New OTA-C Current-Mode Second-Order Filters

Dattaguru V. Kamath*

Abstract—In this paper, a general two-impedance current-mode circuit configuration with single input current using dual-output OTA is explored to derive different types of new second-order filters. The proposed biquads are attractive as they use only grounded capacitors. The proposed biquads have been realized by using various combinations of impedances like OTA based resistor, OTA based inductor and grounded capacitors in the proposed general structure. PSPICE simulation results are also given for the proposed circuits.

Keywords—Active filters, Biquads, Current-mode circuits, DO-OTA, OTA-C filters, SO-OTA

I. INTRODUCTION

The OTA-C approach [1]-[13] is one of the most preferred design methods for continuous-time (CT) integrated filter design at high frequencies. The design of current-mode OTA-C filters employing active elements like Dual Output OTAs (DO-OTA) [3]-[6], [8]-[12] and Multiple Output OTAs (MO-OTA) [7], [13] have been reported. The biquads are the basic building blocks for the realization of CT filters of higher order. In the literature, different circuit configurations for realization of current-mode biquads using OTA have been described i.e., a single DO-OTA and five admittance model [5], two-integrator loop structure [2], [4], [6], [12] etc. The realization of current-mode OTA-C universal biquads using DO-OTA based general two-admittance circuit configuration [9], [10], [11], [13] has been discussed in the literature.

In this paper, the proposed DO-OTA based general current-mode two-admittance circuit structure is presented in Section II. In Section III, the proposed general basic topology is shown to be useful to realize various second-order filters by substituting various admittances in place of Y_n and Y_p. Biquads using only grounded capacitors and in some cases using floating capacitors also have been considered. The analysis of proposed biquads using single-pole finite bandwidth model of the OTA is considered in detail in Section IV. The summary of proposed biquads and comparison with previously reported work is presented in Section V. The SPICE simulation results are presented in Section VI to demonstrate the practical usefulness of the proposed biquads. The concluding remarks are given in Section VII.

II. PROPOSED DO-OTA BASED TWO-ADMITTANCE CIRCUIT CONFIGURATION

The circuit symbol of single output OTA (SO-OTA) and dual output OTA (DO-OTA) used in this work are shown in Fig. 1(a) and (b) respectively. The two current outputs of DO-OTA are given by

\[ I_{o1} = I_{o2} = g_m (V_{i1}^+ - V_{i1}^-) \] (1)

Here, \( I_{o1}, I_{o2} \) are the two output source currents, \( V_{i1}^+ \) and \( V_{i1}^- \) denote non-inverting and inverting input voltages of the DO-OTA respectively. The DO-OTA based two-admittance general current-mode configuration with two input currents has been discussed in [13]. The circuit configuration with single input current for realizing OTA-C third-order band-pass filters is shown in Fig. 2. The generalized current-input current-output (CICO) transfer function for this circuit can be shown to be

\[ \frac{I_o}{I_{in}} = \frac{g_1 Y_n}{Y_p (g_1 + Y_n)} \] (2)

In this section we show that the general basic topology of Fig. 2 can be used to realize two third-order band-pass filter circuits.

A. Current-mode OTA-C second-order band-pass/ high-pass filter BP2/ HP2

The current-mode second-order band-pass/ high-pass filter circuit shown in Fig. 3 can be realized from the basic structure of Fig. 2 by replacing the admittance \( Y_p \) with grounded resistor

Dr. (Prof.) Dattaguru V. Kamath is with the Department of E&C Engg., Manipal Institute of Technology (MIT), Manipal University (MU), Manipal, India (phone: 91-096611942374 (M); e-mail: dv.kamath@manipal.edu, reachdvkamath@yahoo.com)

http://dx.doi.org/10.15242/IIE.E1214012
$1/g_2$ and $Y_n$ with $C_2$ in series with grounded inductor $L_1$. Here the grounded inductance $L_1$ of value $C_1/g_3 g_4$ is realized by OTAs $g_3$ and $g_4$ and capacitor $C_2$.

The two second-order transfer functions realized by the circuit in Fig. 3 are given by

$$\frac{I_{bp2}}{I_{in}} = -\frac{I_{bp2'}}{I_{in}} = \frac{s (g_3 g_4 / g_2 C_1)}{D(s)} \quad (3a)$$

$$\frac{I_{hp2}}{I_{in}} = -\frac{I_{hp2'}}{I_{in}} = \frac{s^2 (g_1 / g_2)}{D(s)} \quad (3b)$$

where

$$D(s) = s^2 + s \frac{g_3 g_4}{g_1 C_1} + \frac{g_3 g_4}{C_1 C_2}$$

The expressions for pole-frequency and pole-Q and their sensitivity values are shown to be

$$\omega_o = \frac{g_3 g_4}{\sqrt{g_1 C_1 C_2}} \quad Q_o = g_1 \sqrt{\frac{C_1}{g_3 g_4 C_2}} \quad (3c)$$

$$S_{g_3}^{\omega_o} = S_{g_4}^{\omega_o} = -S_{C_1}^{\omega_o} = -S_{C_2}^{\omega_o} = 0.5$$

$$S_{C_1}^{Q_o} = -S_{g_3}^{Q_o} = -S_{g_4}^{Q_o} = -S_{C_2}^{Q_o} = 0.5 \quad ; \quad S_{g_1}^{Q_o} = 1 \quad (3d)$$

B. Current-mode OTA-C second-order low-pass/ band-pass filter LP2/ BP2

A current-mode low-pass/ band-pass biquad shown in Fig. 4 is obtained from the basic structure of Fig. 2 by replacing the admittance $Y_p$ with grounded capacitor $C_3$ and $Y_n$ with $C_2$ in series with grounded inductor $L_1$. Here the simulated grounded inductance $L_1$ of value $C_1/g_2 g_3$ is realized by OTAs $g_2$ and $g_3$ and capacitor $C_1$.

The two current-mode transfer functions realized by the circuit of Fig. 4 are given by

$$\frac{I_{lp2}}{I_{in}} = -\frac{I_{lp2'}}{I_{in}} = \frac{s (g_2 g_3/ C_1 C_3)}{D(s)}$$

$$\frac{I_{lp2}}{I_{in}} = \frac{s (g_3/ C_1)}{D(s)} \quad (4a)$$

where

$$D(s) = s^2 + s \frac{g_2 g_3}{g_1 C_1} + \frac{g_2 g_3}{C_1 C_2}$$

The expressions for pole-frequency and pole-Q and their sensitivity values are shown to be

$$\omega_o = \frac{g_2 g_3}{\sqrt{C_1 C_2}} \quad Q_o = g_1 \sqrt{\frac{C_1}{g_2 g_3 C_2}} \quad (4b)$$

$$S_{g_2}^{\omega_o} = S_{g_3}^{\omega_o} = -S_{C_1}^{\omega_o} = -S_{C_2}^{\omega_o} = 0.5$$

$$S_{C_1}^{Q_o} = -S_{g_2}^{Q_o} = -S_{g_3}^{Q_o} = -S_{C_2}^{Q_o} = 0.5 \quad ; \quad S_{g_1}^{Q_o} = 1 \quad (4c)$$

C. Current-mode OTA-C second-order high-pass filter HP2

A current-mode high-pass biquad shown in Fig. 5 can be realized from the basic structure of Fig. 2 by replacing the admittance $Y_p$ with grounded inductance $L_2$ and $Y_n$ with capacitor $C_2$ in series with grounded inductor $L_1$.

The two current-mode transfer functions realized by the circuit of Fig. 5 are given by

$$\frac{I_{hp2}}{I_{in}} = \frac{s (g_3/ C_1)}{D(s)}$$

$$\frac{I_{hp2}}{I_{in}} = \frac{s (g_3/ C_2)}{D(s)} \quad (4d)$$

where

$$D(s) = s^2 + s \frac{g_3}{g_1 C_1} + \frac{g_3}{C_1 C_2}$$

The expressions for pole-frequency and pole-Q and their sensitivity values are shown to be

$$\omega_o = \frac{g_3}{\sqrt{C_1 C_2}} \quad Q_o = g_1 \sqrt{\frac{C_1}{g_3 C_2}} \quad (4e)$$

$$S_{g_3}^{\omega_o} = S_{C_1}^{\omega_o} = -S_{C_2}^{\omega_o} = 0.5$$

$$S_{C_1}^{Q_o} = -S_{g_3}^{Q_o} = -S_{C_2}^{Q_o} = 0.5 \quad ; \quad S_{g_1}^{Q_o} = 1 \quad (4f)$$
The transfer function \( \frac{I_{hp2}}{I_{in}} \) of the circuit of Fig. 5 is given by

\[
\frac{I_{hp2}}{I_{in}} = \frac{1}{\frac{g_2g_3C_1}{g_4g_5C_1} s^2 + s \frac{g_2g_3}{g_4C_1} \frac{g_4g_5}{C_1C_2} + \frac{g_2g_3}{g_4C_1} \frac{g_4g_5}{C_1C_2} + \frac{g_2g_3}{g_4C_1} \frac{g_4g_5}{C_1C_2}}
\]

(5)

The denominator of the transfer function of this circuit is same as that for the biquad of Fig. 4. The expressions for pole-frequency and pole-Q and their sensitivity values for high-pass biquad of Fig. 5 are given by 4(b)-(c).

D. Current-mode OTA-C second-order band-stop filter BS2

The current-mode band-stop biquad shown in Fig. 6 can be realized from the basic structure of Fig. 2 by replacing the admittance \( \frac{1}{g_2} \) with capacitor \( C_3 \) in series with grounded inductor \( L_2 \) and \( g_2 \) in series with grounded inductor \( L_1 \).

\[
\frac{I_{bs2}}{I_{in}} = \frac{g_2g_3C_3}{g_4g_5C_3} s^2 + s \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2}
\]

\[
I_{bs2} = I_{in} \left( \frac{g_2g_3C_3}{g_4g_5C_3} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} \right)
\]

(6a)

Under the condition \( g_2g_3 = g_4g_5 \) and \( C_1C_2 = C_3C_4 \), \( I_{bs2}/I_{in} \) will implement the transfer function of a band-pass biquad given by

\[
\frac{I_{bs2}}{I_{in}} = \frac{g_2g_3C_3}{g_4g_5C_3} s^2 + s \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2} + \frac{g_2g_3}{g_4C_3} \frac{g_4g_5}{C_3C_2}
\]

(6b)

The denominator of the transfer function of this circuit is same as that for the biquad of Fig. 4. The expressions for pole-frequency and pole-Q and their sensitivity values for high-pass biquad of Fig. 5 are given by 4(b)-(c).

E. Current-mode OTA-C second-order band-stop/ low-pass/ band-pass filter BS2/ LP2'/ BP2

A multi-function (band-stop/ low-pass/ band-pass) current-mode biquad shown in Fig. 7 can be realized from the basic structure of Fig. 2 by replacing the admittance \( \frac{1}{g_2} \) with grounded resistor \( g_{in} \) and \( \frac{1}{g_2} \) with grounded inductor \( L_1 \) in parallel with grounded capacitor \( C_2 \). Here the inductance \( L_1 \) of value \( C_1/g_3g_4 \) is realized by OTAs \( g_3 \) and \( g_4 \) and capacitor \( C_4 \).

The various second-order transfer functions realized by the circuit in Fig. 7 are given by

\[
\frac{I_{bs2}}{I_{in}} = \left( \frac{g_1}{g_2} \right) s \left( \frac{g_3}{C_1C_2} \right)
\]

(7a)

\[
\frac{I_{bp2}}{I_{in}} = \left( \frac{g_1}{g_2} \right) \left( \frac{g_3}{C_1C_2} \right)
\]

(7b)

\[
\frac{I_{lp2'}}{I_{in}} = \left( \frac{g_1}{g_2} \right) \left( \frac{g_3}{C_1C_2} \right)
\]

(7c)

where

\[
D(s) = s^2 + \frac{g_1}{C_2} + \frac{g_3g_4}{C_1C_2}
\]

The expressions for pole-frequency and pole-Q and their sensitivity values for multi-function biquad of Fig. 7 are shown to be

\[
\omega_0 = \sqrt{\frac{g_3g_4}{C_1C_2}} ; \quad Q_0 = \frac{1}{g_1} \sqrt{\frac{g_3g_4C_2}{C_1}}
\]

(7d)

\[
S_{g_3}^{\omega_0} = S_{g_4}^{\omega_0} = -S_{c_1}^{\omega_0} = -S_{c_2}^{\omega_0} = 0.5
\]

\[
S_{g_3}^{Q_0} = S_{g_4}^{Q_0} = S_{c_2}^{Q_0} = -S_{c_1}^{Q_0} = 0.5 ; \quad S_{g_1}^{Q_0} = -1
\]

(7e)

IV. EFFECT OF OTA NON-IDEALITIES

In this section, we consider the effect of non-ideal frequency-dependent \( g_m \) of the OTAs on the transfer function.
of the proposed biquads. The single-pole model of the OTA [4] is given by

\[ g_m(s) = \frac{g_m}{1 + st} \]  

(8a)

Here, \( \tau = 1/\omega_p \) where \( \omega_p \) is the dominant pole frequency of the OTA.

Considering the single-pole model of the OTA given by (8a), the denominator of the transfer function (3a)-(3b) for the circuit of Fig. 3 can be shown to be

\[ D(s) = s^5 g_{10} C_1 C_2 \tau_3 + s^3 g_{10} C_1 C_3 (\tau_3 + \tau_4) + s^2 (g_{10} C_1 C_2 + g_{30} g_{40} C_2 \tau_3) \]

\[ + s g_{30} g_{40} C_2 + g_{30} g_{40} \tau_{10} \]  

(8b)

By neglecting the \( s^4 \) term in (8b) and substituting \( s^3 = -s \omega_p^2 \) based on the Akerman-Mossberg approximation [14] so as to obtain the second-order expression

\[ D(s) = s^2 (g_{10} C_1 C_2 + g_{30} g_{40} C_2) + s (g_{30} g_{40} C_2 - \omega_p^2 g_{10} C_2 (\tau_3 + \tau_4)) \]

\[ + g_{30} g_{40} \omega_p \]  

(8c)

Note that the pole-frequency and pole-Q are affected by the bandwidths of the OTAs:

\[ \frac{\omega_p}{\omega_p} = \sqrt{1 + \frac{g_{40} \omega_p}{g_{10} C_2}} \]  

and

\[ \frac{\omega_p Q_p}{\omega_p Q_p} = 1 - \omega_p Q_p (\tau_3 + \tau_4) \]  

(8d)

where the primes indicate the perturbed values of pole-frequency and pole-Q.

Note that the denominator of the transfer function is of the same type for the biquad circuits of Fig. 3, Fig. 4, Fig. 5 and Fig. 6.

Considering the single-pole finite bandwidth model of the OTA, the denominator of the transfer function (7a)-(7c) for the circuit of Fig. 7 will be of fifth-order polynomial and can be shown to be

\[ D(s) = s^5 \left( \frac{r_s r_3 r_4}{\omega_p^2} \right) + s^4 \left( r_s r_3 + r_3 r_4 + r_3 r_4 \right) \]

\[ + s^3 \left( \frac{r_3 + r_4}{\omega_p Q_p} \right) + s^2 \left( \frac{\tau_3 + \tau_4}{\omega_p Q_p} + \frac{1}{\omega_p^2} \right) \]

\[ + s \left( \frac{1}{\omega_p Q_p} + \tau_4 \right) + 1 \]  

(9a)

Evidently the pole-frequency and pole-Q are affected by the bandwidths of the OTAs:

\[ \frac{\omega_p^2}{\omega_p} = 1 + (\tau_3 + \tau_4) \left( \frac{\omega_p}{Q_p} \right) \]  

and

\[ \frac{\omega_p Q_p}{\omega_p Q_p} = 1 - \omega_p Q_p (\tau_3 + \tau_4) - \tau_3 \tau_4 \omega_p^2 \]  

(9b)

V. SUMMARY OF PROPOSED BIQUEDS

In this section, the proposed current-mode biquad filter circuits are compared with the current-mode biquads available in literature. In Table 1 the proposed biquads are compared with the filters presented in [6], [8]-[12]. The proposed current-mode multi-function biquad of Fig. 7 use only grounded capacitors, whereas other biquads (of Fig. 3, Fig. 4, Fig. 5 and Fig. 6) need one or two floating capacitor(s). All the proposed biquads provide good sensitivity with respect to variations in component (transconductor and capacitance) values. The proposed biquads offer advantageous features like ease of design, programmability and orthogonal tunability of pole-Q and pole frequency.

VI. SIMULATION RESULTS

The schematic circuit of SO-OTA and DO-OTA analog blocks used in the simulation of proposed DO-OTA based current-mode biquads are presented in Fig. 8 (a)-(b). The proposed current-mode biquads have been simulated using PSpice simulator using the design details given in Table II. The proposed biquads were also simulated using behavioral voltage controlled current source (VCCS) model of an ideal OTA (i.e., transistor with infinite $R_o$ and zero $C_o$ ) to obtain the ideal characteristics.

The low-pass/ band-pass biquad filter of Fig. 4 has been simulated using $g_1 = 114 \mu S$ ($I_{bias1} = 50 \mu A$), $g_2 = g_3 = 53.9 \mu S$ ($I_{bias2} = I_{bias3} = 10 \mu A$), $C_1 = C_2 = C_3 = 8.58$ pF designed for a pole frequency of 1 MHz corresponding to pole-$Q$ $Q_o = 2.12$ and the resulting amplitude responses are shown in Fig. 11.
The high-pass biquad filter of Fig. 5 has been simulated using \( g_1 = 114 \mu\text{S} \left( I_{\text{bias1}} = 50 \mu\text{A} \right) \), \( g_2 = g_3 = g_4 = g_5 = 53.9 \mu\text{S} \left( I_{\text{bias2}} = I_{\text{bias3}} = I_{\text{bias4}} = I_{\text{bias5}} = 10 \mu\text{A} \right) \), \( C_1 = C_2 = C_3 = C_4 = 8.58 \text{pF} \) designed for a pole frequency of 1 MHz corresponding to pole-\( Q = Q_0 = 2.12 \) and the resulting amplitude response plot is shown in Fig. 12.

The band-stop biquad filter of Fig. 6 has been simulated using \( g_1 = 114 \mu\text{S} \left( I_{\text{bias1}} = 50 \mu\text{A} \right) \), \( g_2 = g_3 = g_4 = g_5 = 53.9 \mu\text{S} \left( I_{\text{bias2}} = I_{\text{bias3}} = I_{\text{bias4}} = I_{\text{bias5}} = 10 \mu\text{A} \right) \), \( C_1 = C_2 = C_3 = C_4 = 8.58 \text{pF} \) designed for a pole frequency of 1 MHz corresponding to pole-\( Q = Q_0 = 2.12 \) and the resulting amplitude response plot is shown in Fig. 13.

The band-stop/low-pass/band-pass biquad filter of Fig. 7 has been simulated using \( g_1 = 53.9 \mu\text{S} \left( I_{\text{bias1}} = 10 \mu\text{A} \right) \), \( g_2 = g_3 = g_4 = 114 \mu\text{S} \left( I_{\text{bias2}} = I_{\text{bias3}} = I_{\text{bias4}} = 50 \mu\text{A} \right) \), \( C_1 = C_2 = 8.58 \text{pF} \) designed for a pole frequency of 2.115 MHz corresponding to pole-\( Q = Q_0 = 2.12 \) and the resulting amplitude response plot is shown in Fig. 14.

PSPICE simulations are carried out for the proposed second-order filter circuits to verify the theoretical results. The simulated results obtained using Tsukutani [12] OTA are in good agreement with the ideal plots obtained using behavioral OTA macro model.

VII. CONCLUSION

The proposed DO-OTA based two-admittance circuit configuration is shown to realize five different second-order filter types having advantageous features like ease of design, programmability, good sensitivity and independent pole-\( Q \) and pole-frequency control. The use of basic general topology for possible realization of third-order OTA-C filters can be investigated.
